Deployed Link: https://v0-music-and-explanation.vercel.app/

Problem statement

- Beginners struggle with complex, abstract music theory
- Existing tools either teach theory or generate music, not both
- Our tool connects music creation with real-time explanation
- Success = users learn faster, experiment more, and stay engaged
- Users gain confidence + understanding while saving time

Live Demo

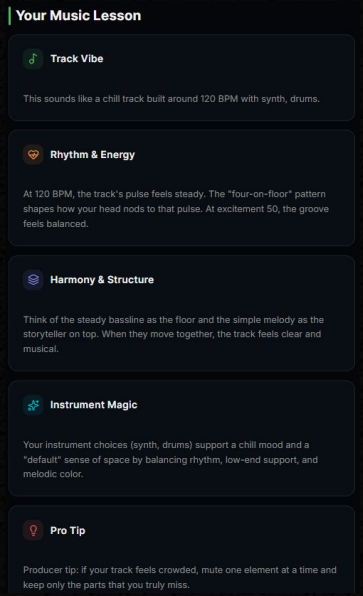
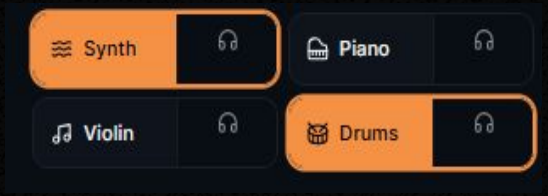
Design Decisions & Challenges Part 1

Technical Aspects:

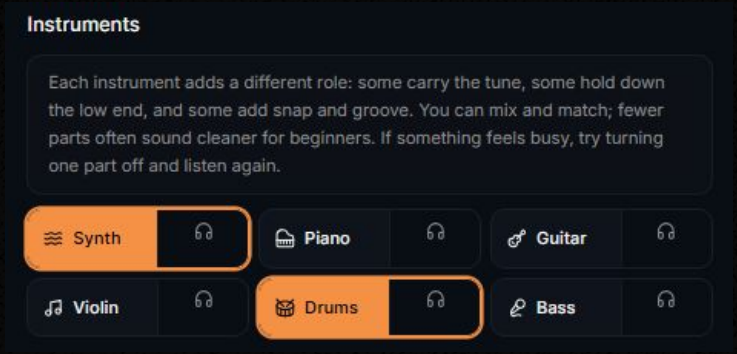
- In order to support the actual “music creation” of our product we used Gemini’s “Lyrically” LLM
- Gemini’s Lyrically is specifically trained in audio/musical creation
- All input data as well as text output from the LLM is used and collected in Supabase
- For text based output we used Gemini Flash 3



D.D.C + Safety/Privacy Part 2



- Initially the model only produced singular beats and could not “layer” music
- Users also did not know what certain elements meant
- We used ChatGPT to help prompt engineer Gemini so it could figure out how to layer music
- We created samples, so users can hear sounds before they select
- There is no personal information collected from the user, simply their inputs and our models outputs



id uuid	created_at timestamptz	description text	mood text	vibe text	instruments text[]	bpm int4

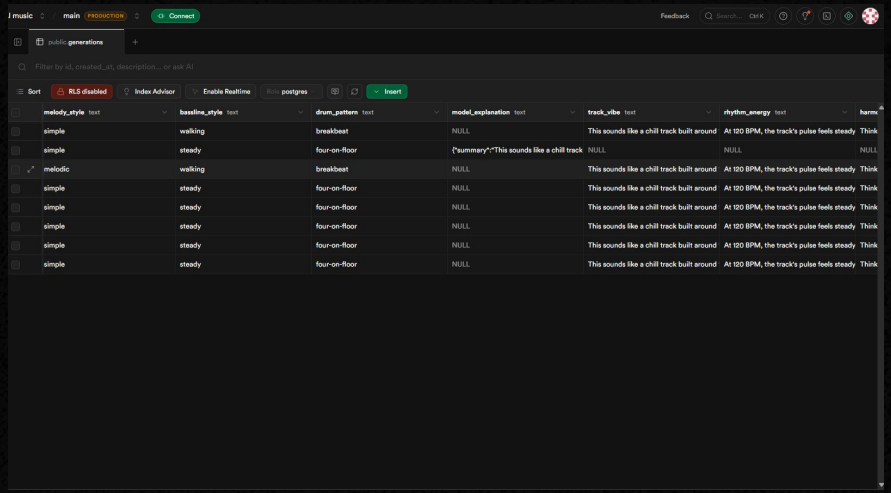
4b952e5f-cfc3-4004-b103-d6490f65dc09	2026-04-10 00:26:17.766965+0	A dreamy sunset	chill	default	["synth","drums"]	120

Next Steps

- We are collecting all of the user input data, as well as the model responses
- When we start to analyze said data the goal will be to have a rating system and feedback, to see if the user can actually learn from the LLM
- The ultimate goal is to learn and have fun making music, and we need to make sure this app can deliver on both fronts
- If users are able to feel this way, then we have achieved our goal



melody_style text	bassline_style text	drum_pattern text	model_explanation text	track_vibe text	rhythm_energy text	harmy
simple	walking	breakbeat	NULL	This sounds like a chill track built around	At 120 BPM, the track's pulse feels steady	Think

THANK YOU

APPENDIX

All 4 of us equally split up work:

Vishruth: Coding, Testing and working on the github

Jihan: Slide Creation + github cleaning

Inika: Slide Creation + github cleaning

Krish: Coding, Testing, API help

Collaboration

We have Biweekly meetings in order to make sure we progressing alone towards the project and its goals

We will continue this up until the final project as well
